Title: Content of Lead, Tin, Copper and Zinc in Canned Meat and Fish Products

Original

Publication: Roczn. Panstw. zakl. hig., 1955, 6, No 4, 277-288

Abstract: To determine lead, tin, copper and zinc in canned meat and fish
products, two samples are prepared: in one, mineralized by the wet
method with HNO_3 and H_2SO_4 followed by dissolution of the precipi-
tate in a hot mixture of HCl and H_2SO_4 , are determined lead, tin and
copper, while in the other sample, subjected to dry combustion, a
determination is made of the zinc. Lead and zinc are determined by
the diphenyl thiocarbazonate method, tin is determined iodometrically
and copper by the carbamate method.

KALINOWSKA, R.

Toxicity of sheets made from expanded poly(vinyl chloride). Regina Kalinowska and Leonia Stulewska (Panstwowe Zaklady Hig., Warszawa). *Roczniki Panstwowego Zakladu Hig.* 10, 117-31(1950)(English summary). The toxicity was investigated of rigid and flexible sheets made from poly(vinyl chloride) which is used as an insulating material. Azodisobutyronitrile (I) was used as a foaming agent, together with a plasticizer. The rigid sheets have an inhibitory influence on the growth of the mice kept in cages lined with the sheets. The I decomp. to tetramethylsuccinonitrile (II) which is the toxic substance. The II migrates from the inner layers to the surface, where it is sublimed into the atm. This process takes about 3-4 months; after that period, sheets lose their toxic properties. F. L. Skolozinski.

TITLE: Magnetic Storms Registered in the Years 1958 and 1959 by the Geophysical Observatory at Świder

PERIODICAL: Acta Geophysica Polonica, 1960, Vol. 8, No. 3, pp. 262 - 267

TEXT: The author discusses magnetic activity and storms as recorded by variometers of the Obserwatorium Geofizyczne (Geophysical Observatory) at Świder in 1958 and 1959. Based on the records obtained and on those for the year 1957, which were published in Acta Geophysica Polonica, 1958, Vol. 8, No. 1, p. 86, a comparison of the magnetic activity is made. The indices of the magnetic activity at Świder during the years 1953 - 1959 are presented in a table. It shows that the greatest number of days with diurnal characteristic $C = 2$ occurred in 1959; also the yearly total of 3-h indices K reached a considerably higher value than the ΣK of the preceding years. Another table presents a record of magnetic storms in 1958 and 1959. The biggest magnetic storms occurred on September 4, 1958, and July 17, 1959; the magnetograms of these two days are included. The storms of February 11, July 8, September 3, 1958, and those of March 26, and

TITLE: Magnetic observations fulfilled in 1957 at the Obser-
watorium geofizyczne im. St. Kalinowskiego (Geophysical
Observatory im. St. Kalinowski) in Swider

PERIODICAL: Referativnyy zhurnal, Geofizika, no. 2, 1962, 32, ab-
stract 2G210 (Prace Obserw. geofiz. Swidzrze, no. 17,
1961, 3-61)

TEXT: At the beginning of the year preparations were made in the
observatory for the IGY. A second series of variometers, fulfilling
as desired normal or rapid recordings, was established in April. A
signaller, advertising the outbreak of a magnetic disturbance with
a bell, was constructed. Observations in accordance with the IGY
program were made from the middle of the year. The apparatus is
described, and its characteristics cited (division rate, tempera-
ture coefficients, etc.). 85 days with a diurnal characteristic
 $C = 0$, 263 days with $C = 1$, and 17 days with $C = 2$ were recorded at

Grossman A., Kalinowski B. New Prospects of Improving the Quality of Coke.

„Nowe możliwości poprawy jakości koksu”. Przegląd Górniczy, No. 1, 1954, pp. 31--34, 3 figs., 6 tabs.

Research carried out proves that coal pulverized during the preliminary operations preceding the charging of coke-oven chambers is partly graded according to specific gravity and granulometry; that is tantamount to partial improvement with various petrographic components having divergent coking properties. This results in the formation within chamber of nests of coal having differing coking properties. Means of preventing such undesirable phenomenon. Prospects of improving the coal charged into the coke-oven with the required petrographic components.

Kalinowski, B.

Kalinowski B., Grossman A., Rojek S. Determining Coke Aptitude by Measuring the Electrical Resistance of Coke Chunks.

„Ustalanie gotowości koksu na podstawie pomiaru oporu elektrycznego bryły koksowej”. Hutnik. No. 8, 1934, pp. 256—259, 3 figs., 1 tab.

Research over the determination of correct coking time has led to the compilation of a method of measurement which makes use of the dependence of electric conductance of coke on its degree of carbonization. The method has been adapted to industrial conditions. It consists in measuring the electrical resistance of coke chunks, by means of two carbon electrodes introduced through opposite doors of the coke-oven chamber and connected by a Wheatstone's bridge. The diagram showing variations in the resistance of the coke chunks as they are being distilled follows a characteristic course, an analysis of which makes it possible to determine coking time.

Temporary operation measures during a breakdown period in a coke-oven battery. Bohdan Kalinowski and Andrzej Grossman. *Hafnik* 21, 277-8 (1954).—A newly constructed coke-oven battery of 38 chambers broke down in the winter and temporary operation measures kept the battery hot during 48 days of the standstill. The temp. in the heating flues was kept at 890-900° and the reversing was carried out every 80 min., as compared to 1180° and 20 min. of reversing time before the breakdown. Coal left in the feed also aged and later on produced coke of poorer abrasion qualities in the repaired battery (which were tested by the "Micum" tumbling-drum method). E. J. H.

KALINOWSKI, B.

The Influence of Mechanical Treatment of Coke on Its Quality. B. Kalinowski, A. Grawman, and F. Janta. (Hdmi), 1964, 21, (10), 524-526. (In Polish). The influence of transporting and screening equipment on the mechanical properties of coke was investigated. On the basis of the results the correct method of handling coke according to its strength has been suggested. --v. u.

„Badania zamarzania węgla w czasie transportu”. Przegląd Chemiczny. No. 2, 1955, pp. 74—76, 1 tab.

Although by greasing truck walls with oils, coal may be prevented from adhering to the walls, the coal still remains frozen. Sprinkling the loaded coal with various oils is ineffective. Good results have been obtained by mixing, in relation to the quantity of coal, 1 per cent of various oils; coal thus treated does not freeze even when exposed for 11 hours in a temperature of -10 to -24° centigrade. The high cost of oil and of the process, however, make this method uneconomical. The most satisfactory results are achieved by the Soviet method of drying coal to such a degree of humidity (safety humidity) that it will not freeze up.

Wpływ zagęszczenia ładunku węglowego na parametry wytrzymałościowe koksu. Prace Instytutu Hutnictwa, No. 7, 5, 1964, pp. 24. Vol. 11 tab. 1.

1) the ramming of the coal charge leads to an increase in coke strength of about 12 per cent and an improvement of abrasion resistance of about 37 per cent, 2) the ramming of the coke charge parallel to the improvement of qualitative parameters of coke leads to an increase in the weight of the charge (single charge with a rammed charge — 18,252 t. with a loose charge — 14,765 t.) Effects of ramming the coal charge on the strength properties of coke: 1) increase in the density of the coal mixture leads to an increase in coke strength, 2) the ramming of the charge improves above all the qualitative parameters of coke, 3) the ramming of the charge makes possible

exchange of high rank and basic coals by coals of lower calorific properties. Thus, the ramming of the charge leads to a decrease in the coke pusher and by means of a roller mill.

A method of confluent two-stage cooling of vapours of naphthalene oil consisting in using a stream of water in addition to a stream of water vapour at a temperature about 100°C. The process can be carried out continually, and naphthalene about 95% pure can be obtained in a single operation. The method shortens by ninety per cent the time of crystallisation of naphthalene oil, and considerably lowers the cost of naphthalene produced.

Title : Evaluation of Mechanical Properties of a Compressed
Coke Charge.
Orig Pub : Przem. chem., 1955, 11, No 10, 594-596
Abstract : Laboratory experiments have been conducted for evalua-
ting the compressibility of a coke charge to which semi-
coke coal tar has been added. The compactness of the
lumps thus obtained was evaluated. The established
relationship between the compactness of the lumps and
the granular size, the moisture content, the tar content
and the degree of compressibility led to the conclusion
that the addition of tar increases the weight of the coke
charge (on lm^3 of a dry material), but is useless in the
compressing.

APPROVED FOR RELEASE: 08/10/2001

CIA-RDP86-00513R000620120002-8

Abstract : The method described is different from the others in that
it uses the electrical resistance of the coke cake as the
measuring parameter. These measurements of the electrores-
istance can be made directly in the coke furnace chamber by
installing coal electrodes of approximately 80mm diameter,
and 1200mm in length, and with an immersion depth of 700mm.
In this way the completeness of the entire coke cake is eval-
uated rather than the separate parts.

TOPIC TAGS: uranium compound, uranium

ABSTRACT: The preparation of UC_2 in the form of dense spherical particles is described. The applied method is based on heating UO_2 particles in a graphite powder bed in a furnace with a graphite heating element up to $2500^\circ C$, in Ar atmosphere under normal pressure. Starting materials such as UO_2 prepared by sintering, unsintered UO_2 and UO_2 agglomerated without additions containing C substances are used. The influence of the UO_2 on the particle size distribution and the product quality is examined. The dependence of free C content and product density on the spherical particles specific surface (diameter) of the product is established and explained. Some of the problems are discussed concerning the increase of the process scale. Orig. art. has: 17 figures and 2 tables. [NA]

AUTHOR: Kalinowski, J.; Dera, J.

TITLE: Luminescence of fluorescent dielectric liquids under the influence of high electric fields

SOURCE: Acta physica polonica, v. 25, no. 2, 1964, 205-210

TOPIC TAGS: dielectric liquid, electroluminescence, fluorescent dielectric luminescence, direct current field, luminescence current dependence, luminescence voltage dependence, luminescence field strength dependence

ABSTRACT: The purpose of the study was to determine the luminescence of various dielectric liquids with fluorescent admixtures under the influence of strong D. C. electric fields. A highly sensitive electrical circuit containing a 220 V D. C. source equipped with filters was applied to movable, 24-mm indiameter spherical brass electrodes in a measuring chamber, equipped with a special purifying system and an optical system containing a Zeiss monochromator, photometer with dark current compensator, photomultiplier, camera, etc. Fields with gradients up to 10^6 volts/cm were obtained. The benzene, which served as a solvent for a solution of POPOP (1,4-bis-(2-(5-phenyl-oxazoyl)-benzene))), was carefully purified, to a specific conductivity of $\sim 10^{-14}$ ohm⁻¹ cm⁻¹.

Card 1/2

ACCESSION NR: AP4024331

The function relating current to luminescence was nonlinear (concave downward). The spectral dependence curves indicate increasing luminescence with increasing voltage gradient and the yield maxima at $5 \times 10^5 \text{ V/cm}$ and $790 \times 10^5 \text{ V/cm}$ occur in the same wave length interval at about $438 \text{ m}\mu$. The line corresponding to maximum yield was selected in the spectral distribution of luminescence and the dependence of its intensity on field gradient was measured subsequent to breakdown in the liquid; the results were steeply linear in the higher field-strength ranges. Interelectrode photographs show different rates of increase in the size of the emitting layers (as the electrodes are approached) with increasing field strength, the length of the emitting layer at the cathode increasing more sharply than at the anode as field strength was increased from 640 to 900 kv/cm. The electroluminescence in the liquid is engendered by the charge carriers traveling within the electric field between the chamber electrodes. "The authors wish to thank Prof. I. Adamczewski for his numerous valuable discussions and hints throughout the present investigation." Orig. art. has: 8 figures.
